

# Displacement functional and absolute continuity of Wasserstein barycenters

Jianyu MA, IMT

March 14, 2024, Séminaire Images Optimisation et Probabilités

## Barycenters

- ▶ Notion of mean for probability measures  $\mu$  on metric spaces  $(E, d)$
- ▶ Always exist in proper spaces (metric spaces whose bounded closed sets are compact)

## Wasserstein spaces $(\mathcal{W}(E), W)$

- ▶ Metric spaces for optimal transport between probability measures on a Polish space (a complete and separable metric space)
- ▶ Wasserstein spaces are Polish spaces.

# Definitions

## Barycenters

- ▶ Notion of mean for probability measures  $\mu$  on metric spaces  $(E, d)$
- ▶ Always exist in proper spaces (metric spaces whose bounded closed sets are compact)

## Wasserstein spaces $(\mathcal{W}(E), W)$

- ▶ Metric spaces for optimal transport between probability measures on a Polish space (a complete and separable metric space)
- ▶ Wasserstein spaces are Polish spaces.

# Wasserstein barycenters

## Definition

Given a Polish space  $(E, d)$ , the Wasserstein space  $(\mathcal{W}(E), W)$  is also Polish, over which we can construct the Wasserstein space  $(\mathcal{W}(\mathcal{W}(E)), \mathbb{W})$ .

Barycenters  $\bar{\mu}$  of measures  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(E))$  are called **Wasserstein barycenters**.

# Wasserstein barycenters

## Definition

Given a Polish space  $(E, d)$ , the Wasserstein space  $(\mathcal{W}(E), W)$  is also Polish, over which we can construct the Wasserstein space  $(\mathcal{W}(\mathcal{W}(E)), \mathbb{W})$ .

Barycenters  $\bar{\mu}$  of measures  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(E))$  are called **Wasserstein barycenters**.

## Remark

By definition,  $\mathbb{P}$  is a probability measure on  $\mathcal{W}(E)$ , its barycenter  $\bar{\mu}$  is thus a probability measure on  $E$ .

# Wasserstein barycenters

## Definition

Given a Polish space  $(E, d)$ , the Wasserstein space  $(\mathcal{W}(E), W)$  is also Polish, over which we can construct the Wasserstein space  $(\mathcal{W}(\mathcal{W}(E)), \mathbb{W})$ .

Barycenters  $\bar{\mu}$  of measures  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(E))$  are called **Wasserstein barycenters**.

## Example (Displacement interpolation)

Consider the earth surface  $(E, d)$  with two uniform measures  $\mu, \nu$  supported on two regions. We simulate the barycenter of  $\frac{1}{2}\delta_\mu + \frac{1}{2}\delta_\nu$  by discrete points.

$$\text{🇫🇷} + \text{🇨🇳} \xrightarrow{\text{barycenter}} \text{🐪} \text{ (llama)}$$

# Wasserstein barycenters

## Definition

Given a Polish space  $(E, d)$ , the Wasserstein space  $(\mathcal{W}(E), W)$  is also Polish, over which we can construct the Wasserstein space  $(\mathcal{W}(\mathcal{W}(E)), \mathbb{W})$ .

Barycenters  $\bar{\mu}$  of measures  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(E))$  are called **Wasserstein barycenters**.

## Existence [Le Gouic and Loubes, 2017]

Assuming that  $(E, d)$  is a proper space, Wasserstein barycenters in  $\mathcal{W}(E)$  always exist.

# Structure of Wasserstein barycenters

Fix a proper space  $(E, d)$  and  $n$  positive real numbers  $\lambda_1, \lambda_2, \dots, \lambda_n$  such that  $\sum_{i=1}^n \lambda_i = 1$ . Given  $n$  measures  $\mu_1, \mu_2, \dots, \mu_n$ , one can construct a barycenter  $\bar{\mu}$  of  $\sum_{i=1}^n \lambda_i \delta_{\mu_i}$  as follows.

Construction of  $\bar{\mu} := B_{\#}\gamma$

1. Let  $B : E^n \rightarrow E$  be a measurable map (barycenter selection map) sending  $(x_1, x_2, \dots, x_n)$  to a barycenter of  $\sum_{i=1}^n \lambda_i \delta_{x_i}$ .
2. Let  $\gamma$  be a measure (multi-marginal optimal transport plan) on  $E^n$  s.t.

$$\int_{E^n} c_{\lambda} d\gamma = \inf_{\theta \in \Theta} \int_{E^n} c_{\lambda} d\theta \quad \text{with } c_{\lambda}(x_1, \dots, x_n) := \inf_{y \in E} \sum_{i=1}^n \lambda_i d(x_i, y)^2,$$

where  $\Theta$  is the set of measures on  $E^n$  with marginals  $\mu_1, \mu_2, \dots, \mu_n$  and  $\gamma \in \Theta$ .

# Structure of Wasserstein barycenters

Fix a proper space  $(E, d)$  and  $n$  positive real numbers  $\lambda_1, \lambda_2, \dots, \lambda_n$  such that  $\sum_{i=1}^n \lambda_i = 1$ . Given  $n$  measures  $\mu_1, \mu_2, \dots, \mu_n$ , one can construct a barycenter  $\bar{\mu}$  of  $\sum_{i=1}^n \lambda_i \delta_{\mu_i}$  as follows.

Construction of  $\bar{\mu} := B_{\#}\gamma$

1. Let  $B : E^n \rightarrow E$  be a measurable map (**barycenter selection map**) sending  $(x_1, x_2, \dots, x_n)$  to a barycenter of  $\sum_{i=1}^n \lambda_i \delta_{x_i}$ .
2. Let  $\gamma$  be a measure (**multi-marginal optimal transport plan**) on  $E^n$  s.t.

$$\int_{E^n} c_{\lambda} d\gamma = \inf_{\theta \in \Theta} \int_{E^n} c_{\lambda} d\theta \quad \text{with } c_{\lambda}(x_1, \dots, x_n) := \inf_{y \in E} \sum_{i=1}^n \lambda_i d(x_i, y)^2,$$

where  $\Theta$  is the set of measures on  $E^n$  with marginals  $\mu_1, \mu_2, \dots, \mu_n$  and  $\gamma \in \Theta$ .

# Structure of Wasserstein barycenters

Fix a proper space  $(E, d)$  and  $n$  positive real numbers  $\lambda_1, \lambda_2, \dots, \lambda_n$  such that  $\sum_{i=1}^n \lambda_i = 1$ . Given  $n$  measures  $\mu_1, \mu_2, \dots, \mu_n$ , one can construct a barycenter  $\bar{\mu}$  of  $\sum_{i=1}^n \lambda_i \delta_{\mu_i}$  as follows.

Construction of  $\bar{\mu} := B_{\#}\gamma$

1. Let  $B : E^n \rightarrow E$  be a measurable map (**barycenter selection map**) sending  $(x_1, x_2, \dots, x_n)$  to a barycenter of  $\sum_{i=1}^n \lambda_i \delta_{x_i}$ .
2. Let  $\gamma$  be a measure (**multi-marginal optimal transport plan**) on  $E^n$  s.t.

$$\int_{E^n} c_{\lambda} d\gamma = \inf_{\theta \in \Theta} \int_{E^n} c_{\lambda} d\theta \quad \text{with} \quad c_{\lambda}(x_1, \dots, x_n) := \inf_{y \in E} \sum_{i=1}^n \lambda_i d(x_i, y)^2,$$

where  $\Theta$  is the set of measures on  $E^n$  with marginals  $\mu_1, \mu_2, \dots, \mu_n$  and  $\gamma \in \Theta$ .

# Structure of Wasserstein barycenters

Fix a proper space  $(E, d)$  and  $n$  positive real numbers  $\lambda_1, \lambda_2, \dots, \lambda_n$  such that  $\sum_{i=1}^n \lambda_i = 1$ . Given  $n$  measures  $\mu_1, \mu_2, \dots, \mu_n$ , one can construct a barycenter  $\bar{\mu}$  of  $\sum_{i=1}^n \lambda_i \delta_{\mu_i}$  as follows.

Why  $\bar{\mu} = B_{\#}\gamma$  is a barycenter?

Notes of current step

Recall

$B$  sends  $\vec{x} = (x_1, \dots, x_n)$  to a barycenter of  $\sum_{i=1}^n \lambda_i \delta_{x_i}$ ;  
 $\gamma$  has marginals  $\mu_1, \dots, \mu_n$ .

$$\begin{aligned} \sum_{i=1}^n \lambda_i W(\mu_i, \bar{\mu})^2 &\leq \sum_{i=1}^n \lambda_i \int_{E^n} d(x_i, B(\vec{x}))^2 d\gamma(\vec{x}) \\ &= \int_{E^n} c_{\lambda}(\vec{x}) d\gamma(\vec{x}) \leq \mathbb{E} c_{\lambda}(X_1, \dots, X_n) \\ &\leq \mathbb{E} \sum_{i=1}^n \lambda_i d(X_i, X)^2 = \sum_{i=1}^n \lambda_i W(\mu_i, \nu)^2 \end{aligned}$$

# Structure of Wasserstein barycenters

Fix a proper space  $(E, d)$  and  $n$  positive real numbers  $\lambda_1, \lambda_2, \dots, \lambda_n$  such that  $\sum_{i=1}^n \lambda_i = 1$ . Given  $n$  measures  $\mu_1, \mu_2, \dots, \mu_n$ , one can construct a barycenter  $\bar{\mu}$  of  $\sum_{i=1}^n \lambda_i \delta_{\mu_i}$  as follows.

Why  $\bar{\mu} = B_{\#}\gamma$  is a barycenter?

Notes of current step

Recall

$c_{\lambda}(\vec{x})$  is the barycenter cost  
 $\inf_{y \in E} \sum_{i=1}^n \lambda_i d(x_i, y)^2$

$$\begin{aligned} \sum_{i=1}^n \lambda_i W(\mu_i, \bar{\mu})^2 &\leq \sum_{i=1}^n \lambda_i \int_{E^n} d(x_i, B(\vec{x}))^2 d\gamma(\vec{x}) \\ &= \int_{E^n} c_{\lambda}(\vec{x}) d\gamma(\vec{x}) \leq \mathbb{E} c_{\lambda}(X_1, \dots, X_n) \\ &\leq \mathbb{E} \sum_{i=1}^n \lambda_i d(X_i, X)^2 = \sum_{i=1}^n \lambda_i W(\mu_i, \nu)^2 \end{aligned}$$

# Structure of Wasserstein barycenters

Fix a proper space  $(E, d)$  and  $n$  positive real numbers  $\lambda_1, \lambda_2, \dots, \lambda_n$  such that  $\sum_{i=1}^n \lambda_i = 1$ . Given  $n$  measures  $\mu_1, \mu_2, \dots, \mu_n$ , one can construct a barycenter  $\bar{\mu}$  of  $\sum_{i=1}^n \lambda_i \delta_{\mu_i}$  as follows.

Why  $\bar{\mu} = B_{\#}\gamma$  is a barycenter?

Notes of current step

Recall

$\gamma$  is an optimal plan w.r.t.  $c_{\lambda}$ ;  
Choose r.v.  $X_i$  with law  $\mu_i$ .

$$\begin{aligned} \sum_{i=1}^n \lambda_i W(\mu_i, \bar{\mu})^2 &\leq \sum_{i=1}^n \lambda_i \int_{E^n} d(x_i, B(\vec{x}))^2 d\gamma(\vec{x}) \\ &= \int_{E^n} c_{\lambda}(\vec{x}) d\gamma(\vec{x}) \leq \mathbb{E} c_{\lambda}(X_1, \dots, X_n) \\ &\leq \mathbb{E} \sum_{i=1}^n \lambda_i d(X_i, X)^2 = \sum_{i=1}^n \lambda_i W(\mu_i, \nu)^2 \end{aligned}$$

# Structure of Wasserstein barycenters

Fix a proper space  $(E, d)$  and  $n$  positive real numbers  $\lambda_1, \lambda_2, \dots, \lambda_n$  such that  $\sum_{i=1}^n \lambda_i = 1$ . Given  $n$  measures  $\mu_1, \mu_2, \dots, \mu_n$ , one can construct a barycenter  $\bar{\mu}$  of  $\sum_{i=1}^n \lambda_i \delta_{\mu_i}$  as follows.

Why  $\bar{\mu} = B_{\#}\gamma$  is a barycenter?

Notes of current step

## Notation

$X$  is a new r.v. with arbitrarily chosen law  $\nu$ ; the coupling  $(X_i, X)$  could be optimal.

$$\begin{aligned} \sum_{i=1}^n \lambda_i W(\mu_i, \bar{\mu})^2 &\leq \sum_{i=1}^n \lambda_i \int_{E^n} d(x_i, B(\vec{x}))^2 d\gamma(\vec{x}) \\ &= \int_{E^n} c_{\lambda}(\vec{x}) d\gamma(\vec{x}) \leq \mathbb{E} c_{\lambda}(X_1, \dots, X_n) \\ &\leq \mathbb{E} \sum_{i=1}^n \lambda_i d(X_i, X)^2 = \sum_{i=1}^n \lambda_i W(\mu_i, \nu)^2 \end{aligned}$$

# Structure of Wasserstein barycenters

Fix a proper space  $(E, d)$  and  $n$  positive real numbers  $\lambda_1, \lambda_2, \dots, \lambda_n$  such that  $\sum_{i=1}^n \lambda_i = 1$ . Given  $n$  measures  $\mu_1, \mu_2, \dots, \mu_n$ , one can construct a barycenter  $\bar{\mu}$  of  $\sum_{i=1}^n \lambda_i \delta_{\mu_i}$  as follows.

Why  $\bar{\mu} = B_{\#}\gamma$  is a barycenter?

Notes of current step

## Conclusion

Choose  $(X_i, X)$  to be optimal.  
 $\bar{\mu}$  is a barycenter since  $\nu$  is arbitrary.

$$\begin{aligned} \sum_{i=1}^n \lambda_i W(\mu_i, \bar{\mu})^2 &\leq \sum_{i=1}^n \lambda_i \int_{E^n} d(x_i, B(\vec{x}))^2 \, d\gamma(\vec{x}) \\ &= \int_{E^n} c_{\lambda}(\vec{x}) \, d\gamma(\vec{x}) \leq \mathbb{E} c_{\lambda}(X_1, \dots, X_n) \\ &\leq \mathbb{E} \sum_{i=1}^n \lambda_i d(X_i, X)^2 = \sum_{i=1}^n \lambda_i W(\mu_i, \nu)^2 \end{aligned}$$

# Structure of Wasserstein barycenters

Fix a proper space  $(E, d)$  and  $n$  positive real numbers  $\lambda_1, \lambda_2, \dots, \lambda_n$  such that  $\sum_{i=1}^n \lambda_i = 1$ . Given  $n$  measures  $\mu_1, \mu_2, \dots, \mu_n$ , one can construct a barycenter  $\bar{\mu}$  of  $\sum_{i=1}^n \lambda_i \delta_{\mu_i}$  as follows.

Why  $\bar{\mu} = B_{\#}\gamma$  is a barycenter?

Notes of current step

## Corollary

Set  $\nu = \bar{\mu}$ ;  $(\text{proj}_i, B)_{\#}\gamma$  is thus an optimal transport plan between  $\mu_i$  and  $\bar{\mu}$ .

$$\begin{aligned} \sum_{i=1}^n \lambda_i W(\mu_i, \bar{\mu})^2 &= \sum_{i=1}^n \lambda_i \int_{E^n} d(x_i, B(\vec{x}))^2 \, d\gamma(\vec{x}) \\ &= \int_{E^n} c_{\lambda}(\vec{x}) \, d\gamma(\vec{x}) \leq \mathbb{E} c_{\lambda}(X_1, \dots, X_n) \\ &\leq \mathbb{E} \sum_{i=1}^n \lambda_i d(X_i, X)^2 = \sum_{i=1}^n \lambda_i W(\mu_i, \bar{\mu})^2 \end{aligned}$$

# Properties of Wasserstein barycenter

## Consistency [Le Gouic and Loubes, 2017]

Let  $(E, d)$  be a proper space. Given a sequence of measures  $\mathbb{P}_j \in \mathcal{W}(\mathcal{W}(E))$  with barycenters  $\bar{\mu}_j$ , if  $\mathbb{W}(\mathbb{P}_j, \mathbb{P}) \rightarrow 0$ , then  $\bar{\mu}_j$  converges to a barycenter of  $\mathbb{P}$  up to extracting a subsequence.

## Remark

Construction for finitely many measures + consistency  $\implies$  general existence.

Indeed, we rely on the consistency to investigate general barycenters.

# Properties of Wasserstein barycenter

## Consistency [Le Gouic and Loubes, 2017]

Let  $(E, d)$  be a proper space. Given a sequence of measures  $\mathbb{P}_j \in \mathcal{W}(\mathcal{W}(E))$  with barycenters  $\bar{\mu}_j$ , if  $\mathbb{W}(\mathbb{P}_j, \mathbb{P}) \rightarrow 0$ , then  $\bar{\mu}_j$  converges to a barycenter of  $\mathbb{P}$  up to extracting a subsequence.

## Uniqueness [Kim and Pass, 2017]

Let  $(M, d_g)$  be a Riemannian manifold. If  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(M))$  gives mass to the set of absolutely continuous measures, then it has a unique barycenter.

# Properties of Wasserstein barycenter

Consistency [Le Gouic and Loubes, 2017]

Let  $(E, d)$  be a proper space. Given a sequence of measures  $\mathbb{P}_j \in \mathcal{W}(\mathcal{W}(E))$  with barycenters  $\bar{\mu}_j$ , if  $\mathbb{W}(\mathbb{P}_j, \mathbb{P}) \rightarrow 0$ , then  $\bar{\mu}_j$  converges to a barycenter of  $\mathbb{P}$  up to extracting a subsequence.

Uniqueness [Kim and Pass, 2017]

Let  $(M, d_g)$  be a Riemannian manifold. If  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(M))$  gives mass to the set of absolutely continuous measures, then it has a unique barycenter.

Absolute continuity [Agueh and Carlier, 2011]

Let  $\mu_1, \mu_2, \dots, \mu_n$  be  $n$  probability measures on  $\mathbb{R}^m$ . If  $\mu_1$  is absolutely continuous with bounded density function, then the unique barycenter of  $\sum_{i=1}^n \lambda_i \delta_{\mu_i}$  is also absolutely continuous.

# Properties of Wasserstein barycenter

Consistency [Le Gouic and Loubes, 2017]

Let  $(E, d)$  be a proper space. Given a sequence of measures  $\mathbb{P}_j \in \mathcal{W}(\mathcal{W}(E))$  with barycenters  $\bar{\mu}_j$ , if  $\mathbb{W}(\mathbb{P}_j, \mathbb{P}) \rightarrow 0$ , then  $\bar{\mu}_j$  converges to a barycenter of  $\mathbb{P}$  up to extracting a subsequence.

Uniqueness [Kim and Pass, 2017]

Let  $(M, d_g)$  be a Riemannian manifold. If  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(M))$  gives mass to the set of absolutely continuous measures, then it has a unique barycenter.

Absolute continuity [Kim and Pass, 2017]

Let  $(M, d_g)$  be a **compact** Riemannian manifold. If  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(M))$  gives mass to a set of absolutely continuous measures **with uniformly bounded density functions**, then its unique barycenter is absolutely continuous.

# How to prove absolute continuity

(a.c stands for absolutely continuous)

## Absolute continuity and compactness [Kim and Pass, 2017]

Let  $(M, d_g)$  be a **compact** Riemannian manifold. If  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(M))$  gives mass to a set of a.c measures **with uniformly bounded density functions**, then its barycenter is a.c.

## Absolute continuity and Ricci curvature bound [Ma, 2023]

Let  $(M, d_g)$  be a complete Riemannian manifold **with a lower Ricci curvature bound**. If  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(M))$  gives mass to the set of a.c measures, then its barycenter  $\bar{\mu}$  is a.c.

# How to prove absolute continuity

Absolute continuity and Ricci curvature bound [Ma, 2023]

Let  $(M, d_g)$  be a complete Riemannian manifold with a lower Ricci curvature bound. If  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(M))$  gives mass to the set of a.c. measures, then its barycenter  $\bar{\mu}$  is a.c.

Sketch of proof, when  $\mathbb{P} = \sum_{i=1}^n \lambda_i \delta_{\mu_i}$  and each  $\mu_i$  has compact support

Similar to the case of displacement interpolation: **locally Lipschitz** + **compactness**

1. When  $\mu_1$  is a.c. and  $\mu_i$ 's for  $2 \leq i \leq n$  are Dirac measures, the optimal transport map from  $\bar{\mu}$  to  $\mu_1$  is **locally Lipschitz**. (See details later)
2. Apply a divide-and-conquer (**conditional measure**) argument for the case when  $\mu_i, 2 \leq i \leq n$  are discrete measures to retain the **Lipschitz estimate**.
3. **Compactness** and Rauch comparison theorem imply a **uniform Lipschitz estimate** for approximating sequences of general  $\mu_i, i \leq 2 \leq n$ .

# How to prove absolute continuity

Absolute continuity and Ricci curvature bound [Ma, 2023]

Let  $(M, d_g)$  be a complete Riemannian manifold with a lower Ricci curvature bound. If  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(M))$  gives mass to the set of a.c measures, then its barycenter  $\bar{\mu}$  is a.c.

Sketch of proof, when  $\mathbb{P} = \sum_{i=1}^n \lambda_i \delta_{\mu_i}$  and each  $\mu_i$  has compact support

Similar to the case of displacement interpolation: **locally Lipschitz** + **compactness**

1. When  $\mu_1$  is a.c and  $\mu_i$ 's for  $2 \leq i \leq n$  are Dirac measures, the optimal transport map from  $\bar{\mu}$  to  $\mu_1$  is **locally Lipschitz**. (See details later)
2. Apply a divide-and-conquer (**conditional measure**) argument for the case when  $\mu_i, 2 \leq i \leq n$  are discrete measures to retain the **Lipschitz estimate**.
3. **Compactness** and Rauch comparison theorem imply a **uniform Lipschitz estimate** for approximating sequences of general  $\mu_i, i \leq 2 \leq n$ .

# How to prove absolute continuity

Absolute continuity and Ricci curvature bound [Ma, 2023]

Let  $(M, d_g)$  be a complete Riemannian manifold with a lower Ricci curvature bound. If  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(M))$  gives mass to the set of a.c measures, then its barycenter  $\bar{\mu}$  is a.c.

Sketch of proof, when  $\mathbb{P} = \sum_{i=1}^n \lambda_i \delta_{\mu_i}$  and each  $\mu_i$  has compact support

Similar to the case of displacement interpolation: **locally Lipschitz** + **compactness**

1. When  $\mu_1$  is a.c and  $\mu_i$ 's for  $2 \leq i \leq n$  are Dirac measures, the optimal transport map from  $\bar{\mu}$  to  $\mu_1$  is **locally Lipschitz**. (See details later)

3. **Compactness** and Rauch comparison theorem imply a **uniform Lipschitz estimate** for approximating sequences of general  $\mu_i, i \leq 2 \leq n$ .

# How to prove absolute continuity

Absolute continuity and Ricci curvature bound [Ma, 2023]

Let  $(M, d_g)$  be a complete Riemannian manifold with a lower Ricci curvature bound. If  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(M))$  gives mass to the set of a.c. measures, then its barycenter  $\bar{\mu}$  is a.c.

Pass to the general case of  $\mathbb{P}$  by consistency

**Hessian equality for Wasserstein barycenters:** let  $\bar{\mu}$  be the unique a.c. barycenter of  $\sum_{i=1}^n \lambda_i \delta_{\mu_i}$  and let  $\exp(-\nabla \phi_i)$  be the optimal transport map between  $\bar{\mu}$  and  $\mu_i$ , then

$$\sum_{i=1}^n \lambda_i \operatorname{Hess} \phi_i = 0.$$

# How to prove absolute continuity

Absolute continuity and Ricci curvature bound [Ma, 2023]

Let  $(M, d_g)$  be a complete Riemannian manifold with a lower Ricci curvature bound. If  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(M))$  gives mass to the set of a.c. measures, then its barycenter  $\bar{\mu}$  is a.c.

Pass to the general case of  $\mathbb{P}$  by consistency

Hessian equality for Wasserstein barycenters: let  $\bar{\mu}$  be the unique a.c. barycenter of  $\sum_{i=1}^n \lambda_i \delta_{\mu_i}$  and let  $\exp(-\nabla \phi_i)$  be the optimal transport map between  $\bar{\mu}$  and  $\mu_i$ , then

$$\sum_{i=1}^n \lambda_i \operatorname{Hess} \phi_i \geq 0.$$

Approach of [Kim and Pass, 2017]: apply change of variable formula in the inequality and bound the density of  $\bar{\mu}$  by a uniform upper bound of those of  $\mu_i$ 's.

# How to prove absolute continuity

Absolute continuity and Ricci curvature bound [Ma, 2023]

Let  $(M, d_g)$  be a complete Riemannian manifold with a lower Ricci curvature bound. If  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(M))$  gives mass to the set of a.c. measures, then its barycenter  $\bar{\mu}$  is a.c.

Pass to the general case of  $\mathbb{P}$  by consistency

Hessian equality for Wasserstein barycenters: let  $\bar{\mu}$  be the unique a.c. barycenter of  $\sum_{i=1}^n \lambda_i \delta_{\mu_i}$  and let  $\exp(-\nabla \phi_i)$  be the optimal transport map between  $\bar{\mu}$  and  $\mu_i$ , then

$$\sum_{i=1}^n \lambda_i \operatorname{Hess} \phi_i = 0.$$

Our approach [Ma, 2023]: define nice functionals admitting finite values only for a.c. measures, and bound them from above with the help of Souslin space theory.

# Absolute continuity of Wasserstein barycenters of finitely many measures

Fix  $\mathbb{P} = \sum_{i=1}^n \lambda_i \delta_{\mu_i}$ , where  $\mu_1$  is a.c with compact support and  $\mu_i = \delta_{x_i}$  for  $i \geq 2$ . Its unique barycenter is  $\bar{\mu} = B_{\#}\gamma$ , where  $B$  is a measurable barycenter selection map and  $\gamma = \mu_1 \otimes \delta_{x_2} \otimes \cdots \delta_{x_n}$  is the unique coupling of its marginals.

## $c$ -conjugating formulation of $B$

1. Define  $c(x, y) := \frac{1}{2} d_g(x, y)^2$  and  $h(y) := -\frac{1}{\lambda_1} \sum_{i=2}^n \lambda_i c(x_i, y)$
2. Given  $x_1 \in M$ ,  $z$  is a barycenter of  $\nu := \sum_{i=1}^n \lambda_i \delta_{x_i}$   
 $\iff z$  reaches the infimum of  $-2\lambda_1 \inf_{y \in M} \{c(x_1, y) - h(y)\}$
3. Define  $X = \text{supp}(\mu_1)$  and  $Y$  the set of barycenters of  $\nu$  when  $x_1$  runs through  $X$ .  
The map  $h$  is smooth on  $Y$  [Kim and Pass, 2015]. Set  $F := \exp(-\nabla h)$ .

$$z \in Y \text{ and } x_1 = F(z) \iff x_1 \in X \text{ and } z \text{ is a barycenter of } \nu$$

**Conclusion:**  $F_{\#}\bar{\mu} = \mu_1$ . Since  $F$  is Lipschitz,  $\bar{\mu}$  is a.c.

# Absolute continuity of Wasserstein barycenters of finitely many measures

Fix  $\mathbb{P} = \sum_{i=1}^n \lambda_i \delta_{\mu_i}$ , where  $\mu_1$  is a.c with compact support and  $\mu_i = \delta_{x_i}$  for  $i \geq 2$ . Its unique barycenter is  $\bar{\mu} = B_{\#}\gamma$ , where  $B$  is a measurable barycenter selection map and  $\gamma = \mu_1 \otimes \delta_{x_2} \otimes \cdots \delta_{x_n}$  is the unique coupling of its marginals.

## $c$ -conjugating formulation of $B$

1. Define  $c(x, y) := \frac{1}{2} d_g(x, y)^2$  and  $h(y) := -\frac{1}{\lambda_1} \sum_{i=2}^n \lambda_i c(x_i, y)$
2. Given  $x_1 \in M$ ,  $z$  is a barycenter of  $\nu := \sum_{i=1}^n \lambda_i \delta_{x_i}$   
 $\iff z$  reaches the infimum of  $2\lambda_1 \inf_{y \in M} \{c(x_1, y) - h(y)\}$
3. Define  $X = \text{supp}(\mu_1)$  and  $Y$  the set of barycenters of  $\nu$  when  $x_1$  runs through  $X$ .  
The map  $h$  is smooth on  $Y$  [Kim and Pass, 2015]. Set  $F := \exp(-\nabla h)$ .

$$z \in Y \text{ and } x_1 = F(z) \iff x_1 \in X \text{ and } z \text{ is a barycenter of } \nu$$

Conclusion:  $F_{\#}\bar{\mu} = \mu_1$ . Since  $F$  is Lipschitz,  $\bar{\mu}$  is a.c.

# Absolute continuity of Wasserstein barycenters of finitely many measures

Fix  $\mathbb{P} = \sum_{i=1}^n \lambda_i \delta_{\mu_i}$ , where  $\mu_1$  is a.c with compact support and  $\mu_i = \delta_{x_i}$  for  $i \geq 2$ . Its unique barycenter is  $\bar{\mu} = B_{\#}\gamma$ , where  $B$  is a measurable barycenter selection map and  $\gamma = \mu_1 \otimes \delta_{x_2} \otimes \cdots \delta_{x_n}$  is the unique coupling of its marginals.

## Difference from classical displacement functionals

Gradient flow theory (**first-order**) and displacement convexity (**second-order**) gives that

$$\mathcal{G}(\mu_i) \geq \mathcal{G}(\bar{\mu}) + \int_M \Delta \phi_i H'(\log f) \, d\bar{\mu} - \frac{L_H K}{2} W_2(\bar{\mu}, \mu_i)^2, \quad 1 \leq i \leq k.$$

# Preservation of absolute continuity when passing to the limit

## Reminder of the problem setting

We approximate a general measure  $\mathbb{P} \in \mathcal{W}(\mathcal{W}(M))$  with  $\mathbb{P}_j$ . After proving that the barycenter  $\bar{\mu}_j$  of  $\mathbb{P}_j$  is a.c, how to show that the barycenter  $\bar{\mu} = \lim \bar{\mu}_j$  of  $\mathbb{P}$  is also a.c?

## Use displacement functionals $\mathcal{G}$ admitting finite values only for a.c measures

1. Assume  $G$  is in addition super-linear and convex, then  $\mathcal{G}$  is lower semi-continuous;
2. Bound  $\{\mathcal{G}(\bar{\mu}_j)\}_{j \geq 1}$  from above, for which we use the displacement inequality;
3. By choosing the sequence  $\mathbb{P}_j$  properly, it reduces to show that  $\mathbb{P}$  gives mass to a  $B(G, L)$  set, the set of a.c measures whose values under  $\mathcal{G}$  are bounded by  $L > 0$ ;
4. Compact sets w.r.t. the  $\sigma(L^1, L^\infty)$  topology are  $B(G, L)$  sets;
5. Souslin space theory implies that several different topologies of a.c measures generate the same Borel sets, on which  $\mathbb{P}$  is a Radon measure.

## Justifications for the generalized displacement functionals

$$\mathcal{G}(\bar{\mu}) \leq \sum_{i=1}^k \frac{\lambda_i}{\Lambda} \mathcal{G}(\mu_i) + \frac{L_H K}{2\Lambda} \mathbb{W}(\mathbb{P}, \delta_{\bar{\mu}})^2 + \frac{L_H}{2\Lambda} (m^2 + 2m)$$

### Step 1, change of variables

Denote by  $F_i$  the optimal transport map from  $\bar{\mu}$  to  $\mu_i$ , by  $\text{Jac } F_i$  the Jacobian of  $F_i$ . Since  $f = g(F_i) \text{Jac } F_i$ ,  $\mathcal{G}(\mu_i) = \int_M H(\log f + l_i) \, d\bar{\mu}$ , where  $l_i := -\log \text{Jac } F_i$ .

## Justifications for the generalized displacement functionals

$$\mathcal{G}(\bar{\mu}) \leq \sum_{i=1}^k \frac{\lambda_i}{\Lambda} \mathcal{G}(\mu_i) + \frac{L_H K}{2\Lambda} \mathbb{W}(\mathbb{P}, \delta_{\bar{\mu}})^2 + \frac{L_H}{2\Lambda} (m^2 + 2m)$$

### Step 1, change of variables

Denote by  $F_i$  the optimal transport map from  $\bar{\mu}$  to  $\mu_i$ , by  $\text{Jac } F_i$  the Jacobian of  $F_i$ . Since  $f = g(F_i) \text{Jac } F_i$ ,  $\mathcal{G}(\mu_i) = \int_M H(\log f + l_i) \, d\bar{\mu}$ , where  $l_i := -\log \text{Jac } F_i$ . By McCann-Brenier theorem,  $F_i = \exp(-\nabla \phi_i)$  with  $\phi_i$  a  $c$ -concave function.

# Justifications for the generalized displacement functionals

$$\mathcal{G}(\bar{\mu}) \leq \sum_{i=1}^k \frac{\lambda_i}{\Lambda} \mathcal{G}(\mu_i) + \frac{L_H K}{2\Lambda} \mathbb{W}(\mathbb{P}, \delta_{\bar{\mu}})^2 + \frac{L_H}{2\Lambda} (m^2 + 2m)$$

## Step 1, change of variables

Denote by  $F_i$  the optimal transport map from  $\bar{\mu}$  to  $\mu_i$ , by  $\text{Jac } F_i$  the Jacobian of  $F_i$ . Since  $f = g(F_i) \text{Jac } F_i$ ,  $\mathcal{G}(\mu_i) = \int_M H(\log f + l_i) \, d\bar{\mu}$ , where  $l_i := -\log \text{Jac } F_i$ . By McCann-Brenier theorem,  $F_i = \exp(-\nabla \phi_i)$  with  $\phi_i$  a  $c$ -concave function.

## Step 2, apply Ricci curvature bound

Jacobi equation for  $d \exp(-\nabla \phi_i)$  implies  $l_i \geq \Delta \phi_i - K \|\nabla \phi_i\|^2/2$  for  $1 \leq i \leq k$ .

Second variation formula implies  $m + m^2/2 \geq \Delta \phi_i - K \|\nabla \phi_i\|^2/2$ . [Cordero-Erausquin et al., 2001]

## Justifications for the generalized displacement functionals

$$\mathcal{G}(\bar{\mu}) \leq \sum_{i=1}^k \frac{\lambda_i}{\Lambda} \mathcal{G}(\mu_i) + \frac{L_H K}{2\Lambda} \mathbb{W}(\mathbb{P}, \delta_{\bar{\mu}})^2 + \frac{L_H}{2\Lambda} (m^2 + 2m)$$

### Step 1, change of variables

Denote by  $F_i$  the optimal transport map from  $\bar{\mu}$  to  $\mu_i$ , by  $\text{Jac } F_i$  the Jacobian of  $F_i$ . Since  $f = g(F_i) \text{Jac } F_i$ ,  $\mathcal{G}(\mu_i) = \int_M H(\log f + l_i) \, d\bar{\mu}$ , where  $l_i := -\log \text{Jac } F_i$ . By McCann-Brenier theorem,  $F_i = \exp(-\nabla \phi_i)$  with  $\phi_i$  a  $c$ -concave function.

### Step 2, apply Ricci curvature bound

Jacobi equation for  $d \exp(-\nabla \phi_i)$  implies  $l_i \geq \Delta \phi_i - K \|\nabla \phi_i\|^2/2$  for  $1 \leq i \leq k$ . Second variation formula implies  $m + m^2/2 \geq \Delta \phi_i - K \|\nabla \phi_i\|^2/2$ . [Cordero-Erausquin et al., 2001]

### Step 3, apply assumptions on $H$

$$H(\log f + l_i) - H(\log f) \geq L_H(\Delta \phi_i - K \|\nabla \phi_i\|^2/2) - L_H(m + m^2/2).$$

# Justifications for the generalized displacement functionals

$$\mathcal{G}(\bar{\mu}) \leq \sum_{i=1}^k \frac{\lambda_i}{\Lambda} \mathcal{G}(\mu_i) + \frac{L_H K}{2\Lambda} \mathbb{W}(\mathbb{P}, \delta_{\bar{\mu}})^2 + \frac{L_H}{2\Lambda} (m^2 + 2m)$$

## Step 1, change of variables

Denote by  $F_i$  the optimal transport map from  $\bar{\mu}$  to  $\mu_i$ , by  $\text{Jac } F_i$  the Jacobian of  $F_i$ . Since  $f = g(F_i) \text{Jac } F_i$ ,  $\mathcal{G}(\mu_i) = \int_M H(\log f + l_i) d\bar{\mu}$ , where  $l_i := -\log \text{Jac } F_i$ . By McCann-Brenier theorem,  $F_i = \exp(-\nabla \phi_i)$  with  $\phi_i$  a  $c$ -concave function.

## Step 2, apply Ricci curvature bound

Jacobi equation for  $d \exp(-\nabla \phi_i)$  implies  $l_i \geq \Delta \phi_i - K \|\nabla \phi_i\|^2/2$  for  $1 \leq i \leq k$ . Second variation formula implies  $m + m^2/2 \geq \Delta \phi_i - K \|\nabla \phi_i\|^2/2$ . [Cordero-Erausquin et al., 2001]

## Step 3, apply assumptions on $H$

$$H(\log f + l_i) - H(\log f) \geq L_H(\Delta \phi_i - K \|\nabla \phi_i\|^2/2) - L_H(m + m^2/2).$$

## Step 4, integrate and apply the Hessian equality

The Hessian equality  $\sum_{i=1}^n \lambda_i \text{Hess}_x \phi_i = 0$  implies  $\sum_{i=1}^n \lambda_i \Delta \phi_i(x) = 0$ .
